Generation Zero® is a massive Sci-Fi RTS available now on PC.1. Field of the Invention The present invention relates to a fastening mechanism for a seat belt. 2. Related Art Hitherto, there has been disclosed a seat belt fastening mechanism having a locking mechanism for locking a tongue plate for fastening a seat belt to a vehicle body side, a drive mechanism for driving the locking mechanism to lock the tongue plate and a release mechanism for releasing the locked state of the tongue plate from the vehicle body side. The vehicle seat belt fastening mechanism of this type is preferably automatically actuated by an automatic locking and unlocking mechanism at the time of a collision of the vehicle. In this type of seat belt fastening mechanism, the automatic locking and unlocking mechanism is actuated by a collision detecting device which may include a tensile load detecting mechanism or a compression load detecting mechanism. However, a cost of the tensile load detecting mechanism is high and in some cases, it is preferable that the tensile load detecting mechanism is not installed in the seat belt fastening mechanism. Also, the compression load detecting mechanism is suitable for detecting the collision of the vehicle but in such a case, it is difficult to provide a free space for installing the compression load detecting mechanism in the seat belt fastening mechanism. Further, in this case, the adding of the compression load detecting mechanism to the seat belt fastening mechanism causes a cost increase of the seat belt fastening mechanism. There are various crash modes such as a front-on collision mode wherein a collision occurs in the front end of the vehicle, a side-on collision mode wherein a collision occurs in the side portion of the vehicle, and a rear-on collision mode wherein a collision occurs in the rear end portion of the vehicle. Conventional seat belt fastening mechanisms are adapted to automatically unlock the seat belt in all of the above-described crash modes. However, the seat belt fastening mechanism which is adapted to automatically unlock the seat belt in all of the above-described crash modes may have the following problems. For example, in the side-on collision
